Properties and Changes of Materials

Today I would like you to carry out some research - take some time to search the internet. I would like you to choose three materials and research what would happen to each material if it was put into contact with a flame.

Can you describe the changes that would take place? Please explain in your own words using any scientific vocabulary that you understand. I have attached a worksheet if you would like to use it. Below are some ideas of different materials that you could choose to research. You may have your own ideas about which materials to research. It is up to you!

Ideas of different materials

chocolate logs newspaper mug

Please take a photograph of your work and send it in using Dojo. Thank you ©
